

Application User Rights

Appian 7.6

Initially, only the creator of an application can view, edit, and update the application object and its properties. Any application you create must have rights assigned before other users can interact with it. Users who import an application, must have edit rights (for a new application) or Administrator rights (to update an existing application). These user rights must be assigned to the user specifically, or to the group that the user belongs to, prior to exporting the application. See [Application Deployment Guidelines](#) for additional details.

Toggle Us

Assigning User Rights for an Application

- In the [Application Builder](#), select the checkbox next to the application. The Security button is displayed.
- Click **Security** on the toolbar. The Configure Security dialog box is displayed.
- (Optional) Provide all users with viewer rights to the application by selecting **Viewer** from the **By default, users have [...]** list. The group **all users** is added to the user rights listed. (This option enables any user of the system to view the application. In a similar manner, you can assign editor or administrator rights to all users.)
- Click **Add users and groups**. The Choose Users and Groups combination box is displayed. Select a user or group that you want to provide with rights to the application. Click **OK**. The user or group is added to the list of rights displayed.
- Assign rights for the user or group by selecting from the following options.

Actions	Administrator	Editor	Viewer
View	X	X	X
Export	X	X	X
Edit	X	X	
Save	X	X	
Delete	X	X	
Hide	X	X	
Publish	X	X	
Import	X		
View or Modify Security	X		

Deny

- Users assigned the deny role cannot view, edit, or administer the application.

Application Objects

Users must also have viewer rights assigned for the objects contained in the application.

- We recommend assigning user rights for each object to groups, and including these groups in the application.
- The available roles vary according to each application object. Each object includes the following roles at a minimum.
 - Administrator
 - Editor / Author
 - Viewer / Read Only / Public
